

Floury leafy

WRV 3995FL - Leafy Silage Hybrid

HYBRID CHARACTERISTICS

Relative Maturity: 95 RM	Plant Height for Maturity: Med -Tall
Seedling Vigor: Excellent	Kernel Texture: Soft 25% Flour
Ear Flex: Excellent	Ear Type: White Cob

WRV 3995FL Based on Whole Plant Percentage:

NDF = Low

NFC = High

NDFd = Medium

Recommended Planting Population = 26 to 28,000 dryland; 30-32,000

✓ HIGHLIGHTS OF WRV 3995FL

- Next generation in highly digestible leafy hybrids
- Kernels on the ear (when grown in a block) will have 25% pure flour type and 75% normal, which are quite floury in comparison to normal hybrids.
- Provides rapidly digestible starch to improve cattle utilization
- High NFC content silage produces very high milk per ton forage
- Great fit into milk production rations
- Exhibits extreme flex cob traits at lower populations
- Harvest window is wider than 2096L or 2096LRR

– CHARACTERISTICS of LEAFY SILAGE SPECIFIC HYBRIDS

1. Leafy hybrids will typically produce 7-10 leaves above the ear resulting in increased yields over non-leafy hybrids
2. Thinner stalk rind, which is traditionally 50-54% digestible
3. Increased pith size in the stalk, which is 72-74% digestible
4. Soft, more floury type kernel textures which increase starch digestibility
5. Increased harvest window due to slower kernel fill. The slow kernel fill allows the stalk and leaves more drying time, which results in more equal overall plant and cob moisture levels
6. WRV Silage specific varieties are selected to provide above average NDFd by nature of highly digestible forage quality
7. Choose a maturity suited for your area. Ideally, plant maturity and harvest should take place prior to a frost to maximize your levels of plant sugars and carbohydrates
8. Most Leafy hybrids will exhibit white cobs with soft texture

WRV 3995FL is available as a conventional or Roundup Ready
